1. Learn

In this lesson, you saw how to use the **C.L.E.A.R. steps** methodically to capture and direct people's attention.

Lesson Summary

From now on, when designing a new screen or trying to improve something that feels off, you'll be able to rely on these 5 steps:

The C.L.E.A.R. UI framework

1. C – Copywriting : Tell people why to care, what to do, and what will happen next.
2. L – Layout : Group, position, and align elements to make the screen easy to understand.
3. E – Emphasis : Make sure people can't miss the one thing that matters.
4. A – Accessibility : Design for different abilities so more people can use it with ease.
5. R – Reward : Turn any boring interaction into something that feels good.

The goal of this framework is also to create beautiful UIs, because—

PSYCHOLOGY INSIGHT

Aesthetic usability

Beautiful interfaces feel easier to use.[1] When a screen looks polished and coherent, people tend to assume it's more usable and forgive minor issues more easily.

[1] *Aesthetic usability effect, NN Group*

2. Practice

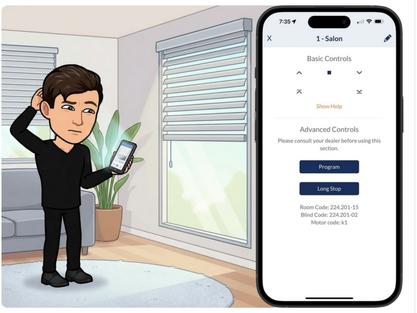
Now let's do a quick "attention" test:

YOUR PRACTICE

House Blind Controls

Imagine you just bought a really nice set of new automatic smart blinds for your living room. After the installation, you realize there's also an app to control the blinds.

You open it and land on this:



Now, in **which zone** of the screen did you look first...

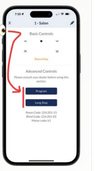
- Did your eyes go to zone A or zone B?👇

- Do you believe it's where the attention should be?

Want more details?

See the explanation below

Most likely, your eyes glazed over A to directly **look at B** (see this image ↓).



Here's why:

The Emphasis is completely upside down.

The "Program" and "Long Stop" buttons carry the most visual weight—big CTAs, dark color, strong contrast on an almost empty white screen.

And the basic controls at the top are tiny and awkwardly placed; they visually whisper while the CTAs shout:

> *"Hey, I'm a BIG BLUE button, TAP ME!"*

...but the twist is that these buttons are dangerous, as the section subtitle above quietly says:

> *"Please **consult your dealer** before using this section."*

So not only is the screen designed to pull your attention to the wrong place, but it's also pointing you toward a "dangerous" action that shouldn't be this easy to access.

That's why learning the C.L.E.A.R. framework is essential when building interfaces, so you can at least spot these potentially very frustrating mistakes.

3. Apply

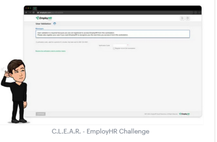
Now, before diving deep into each pillar of the C.L.E.A.R. framework, let's do a quick test.

The goal of this exercise is to evaluate your current skills.

YOUR CHALLENGE

Redesign – Before C.L.E.A.R. UI Course

Context:
Imagine you log in to your employee HR platform and land on this page to verify your identity after entering your email address and password. It's a common "one-time password" screen, except it isn't very *clear*...



C.L.E.A.R. - EmployHR Challenge

Question:
How might you redesign this prompt to make it easier to scan, understand, and take action?

You can use this Figma template for your redesign.

Figma Instructions

All components in the file are ready to be modified.

If you're logged in to your Figma account, this Figma link will automatically duplicate a new file.

If you're not logged in, you won't be able to edit the file. Sign up/Log in first, then click the file name (small down arrow) to open the options menu, and click "duplicate."

Don't skip!

There are **no bad answers** here. The goal isn't to apply the whole framework; it's to give you a way to assess your skills now. At the end of the course, we'll ask you to do the same redesign, this time with all the knowledge and tips you've learnt in this course. That way, you can compare and judge your progress:

- [ ] **I've done the first redesign challenge!**
  Even if you have little UI skills now, try redesigning the screen to the best of your ability. Once completed, you can check this box and complete the lesson below.

PRO TIP

Practice makes perfect

There's no shortcut to becoming better at UI design (or at anything.) You have to practice. A lot. And then... **Mastery comes**. Make sure you get your reps and sets to improve faster.
